

DSpecM1D analogues of Ivan & He Figs. 1-3

PREM, 300 km explosive source; vertical velocity.

Displayed every 0.5°; underlying calculation uses continuous 0.25° receivers. Shading marks the approximate analysis intervals.

Figure B. PKIKP and PKP-Bdiff synthetic waveforms

Vertical velocity; 0.4-Hz zero-phase low-pass; traces independently normalised; polarity retained.

Receivers: 139.0°, 139.5°, 140.0°, 140.5°, 141.0°, 141.5°, 142.0° and 142.5°.

Arrows mark representative branch arrivals, not formal picks.

Figure C. PKIKP and PKP-Cdiff synthetic waveforms

Run parameters

Parameter	Value
DSpecM1D	v1.0.0 / commit 9b13dc5
Model / source	isotropic PREM / explosive diagonal moment tensor
Source depth	300 km
Receiver sampling	underlying continuous 136–162° at 0.25°; Z velocity
Broadband range	0.001–1000 mHz; record 2048 s; dt=0.25 s
Numerics	l maximum 12000; tolerance 1e-3
Physics	attenuation off; self-gravity on; rotation off
B display	0.4-Hz low-pass; independent normalisation; polarity retained
C display	1.0-Hz low-pass; independent normalisation; polarity retained
Main solve	90 threads; wall 0:49:10.84; peak RSS 10339 MiB
Bridge solve	90 threads; wall 0:49:09.42; peak RSS 10136 MiB

Qualitative analogue, not an exact reproduction: PREM and a 300-km explosive source replace the paper's ak135/GCMT configuration.
